(54) Mail synchronization of remote and local mail systems

(57) The present invention relates to a mail synchronization system. A local mail system (104) provides electronic mail services to a desktop computer (114) and includes a local mail server (116) and a mail synchronization client (118). The local mail server manages storage, receipt and delivery of electronic mail messages with respect to the desktop computer, can display a list of electronic mail messages in a local inbox, and stores the list in the local mail server. A wireless mail system (112) provides electronic mail services to a mobile device (108) and includes a mobile device mail application, a mobile device mail server and a mail synchronization server. The mobile device mail server manages storage, receipt and delivery of electronic mail messages with respect to the mobile device, can display a list of electronic mail messages in a remote inbox, and stores the list in the mobile device mail server. The mail synchronization client and said mail synchronization server interact to synchronize the list of the electronic mail messages for the local inbox and the remote inbox in a two way manner without user interaction. Thus, the user is able to effectively see and interact with only a single "virtual" mailbox, which is the synchronized combination of the two different electronic mailboxes.
